

What is claimed is:

- 1 1. A device for use in an interactive cable television system, the device  
2 comprising:  
3 a hardware peripheral device coupled to a computer modem at a user  
4 premises and in communication with a computer network, for  
5 communicating data from a user via the computer network to a cable  
6 television network head end to control a television information signal  
7 provided over a cable television network cable connected directly to a  
8 digital cable ready television at the user premises.
- 1 2. A device according to claim 1, wherein the peripheral device is integrated into  
2 a single unit with the computer modem.
- 1 3. A device according to claim 1, wherein the peripheral device is a separate unit  
2 from the computer modem and connected to an input port on the computer  
3 modem.
- 1 4. A device according to claim 1, wherein the peripheral device uses an infrared  
2 (IR) link for at least one of receiving the data from the user and controlling the  
3 television information signal.
- 1 5. A device according to claim 1, wherein the peripheral device uses a radio  
2 frequency (RF) link for at least one of receiving the data from the user and  
3 controlling the television information signal.
- 1 6. A device according to claim 1, further comprising:  
2 a status indicator section showing a current status of the peripheral device.

- 1 7. A method for cable television system communication, the method comprising:  
2 controlling a television information signal provided by a cable television  
3 network cable connected directly to a digital cable ready television at a  
4 user premises based on data communicated by a user to a peripheral  
5 device coupled to a computer modem at the user premises and in  
6 communication with a computer network, via the computer network to  
7 a cable television network head end.
- 1 8. A method according to claim 7, wherein the peripheral device is integrated  
2 into a single unit with the computer modem.
- 1 9. A method according to claim 7, wherein the peripheral device is a separate  
2 unit from the computer modem and connected to an input port on the computer  
3 modem.
- 1 10. A method according to claim 7, further comprising:  
2 controlling the television information signal using an infrared (IF) link  
3 from the peripheral device.
- 1 11. A method according to claim 7, further comprising:  
2 controlling the television information signal using a radio frequency (RF)  
3 link from the peripheral device.
- 1 12. A method according to claim 7, further comprising:  
2 showing a current status of the peripheral device on a status indicator.
- 1 13. An interactive cable television system comprising:  
2 a computer network;

3 a computer modem at a user premises in communication with the computer  
4 network;  
5 a cable television network including a head end for providing a television  
6 information signal over a cable television network cable directly to a  
7 digital cable ready television at the user premises, the television having  
8 a display responsive to the television information signal;  
9 a hardware peripheral device coupled to the modem for communicating data  
10 from a user via the computer network to the head end to control the  
11 television information signal.

1 14. A system according to claim 13, wherein the peripheral device is integrated  
2 into a single unit with the computer modem.

1 15. A system according to claim 13, wherein the peripheral device is a separate  
2 unit from the computer modem and connected to an input port on the computer  
3 modem.

1 16. A system according to claim 13, wherein the peripheral device uses an infrared  
2 (IR) link for at least one of receiving the data from the user and controlling the  
3 television information signal.

1 17. A system according to claim 13, wherein the peripheral device uses a radio  
2 frequency (RF) link for at least one of receiving the data from the user and  
3 controlling the television information signal.

1 18. A system according to claim 13, further comprising:  
2 a status indicator section showing a current status of the peripheral device.

1 19. A device for use in an interactive cable television system, the device

- 2 comprising:
- 3 a hardware peripheral device having:
- 4 i. a receiver for receiving data from a user input device,
- 5 ii. a processor responsive to the data for sending communications
- 6 through a computer modem at a user premises over a computer
- 7 network to a cable television network head end, and
- 8 iii. an output for controlling a television information signal:
- 9 (a) provided by a cable television network cable connected
- 10 directly to a digital cable ready television at the user premises,
- 11 (b) from the head end responsive to the communications from
- 12 the hardware peripheral device.

1 20. A device according to claim 19, wherein the peripheral device is integrated

2 into a single unit with the computer modem.

1 21. A device according to claim 19, wherein the peripheral device is a separate

2 unit from the computer modem and connected to an input port on the computer

3 modem.

1 22. A device according to claim 19, wherein the peripheral device uses an infrared

2 (IR) link for at least one of receiving the data from the user and controlling the

3 television.

1 23. A device according to claim 19, wherein the peripheral device uses a radio

2 frequency (RF) link for at least one of receiving the data from the user and

3 controlling the television.

1 24. A device according to claim 19, further comprising:

2 a status indicator section showing a current status of the peripheral device.

1 25. An interactive cable television system comprising:  
2 a computer modem at a user premises and in communication with a  
3 computer network;  
4 a user input device;  
5 a hardware peripheral device having:  
6 i. a receiver for receiving data from the user input device, and  
7 ii. a processor responsive to the data for sending communications  
8 through the computer modem to a cable head end; and  
9 a digital cable ready television at the user premises and directly connected  
10 to a cable television network cable for displaying a television information signal  
11 provided over the cable from the head end controlled by the communications  
12 from the hardware peripheral device.

1 26. A system according to claim 25, wherein the peripheral device is integrated  
2 into a single unit with the computer modem.

1 27. A system according to claim 25, wherein the peripheral device is a separate  
2 unit from the computer modem and connected to an input port on the computer  
3 modem.

1 28. A system according to claim 25, wherein the peripheral device uses an infrared  
2 (IR) link for at least one of receiving the data from the user and controlling the  
3 television information signal.

1 29. A system according to claim 25, wherein the peripheral device uses a radio  
2 frequency (RF) link for at least one of receiving the data from the user and  
3 controlling the television information signal.

- 1 30. A system according to claim 25, further comprising:
- 2 a status indicator section showing a current status of the peripheral device.
